

DESCRIPTION

The EASI-cell cluster system is specifically designed for areas where space is limited and traffic speeds do not exceed 72 km/h. these hazards include tollbooths, utility poles, railroad crossing signals, traffic lights, etc. The EASI-cell Cluster System also features extraordinary reusability.

The EASI-cell cluster system consists of HMW/HDPE cylinders fastened into a cluster. Like its predecessor, the Hydro® Cell Cluster, the variety of available cluster configurations is virtually limitless, but without the mess and hazard of water/antifreeze on the roadway after an impact or the inconvenience of having to refill the water cells.

The EASI-cell cluster system is crashworthy and has tested to the NCHRP 350 testing procedures for TL-2 conditions up to 72 km/h.

- Gating
- Non-redirecting
- Pocketing
- Bidirectional or unidirectional
- Very high reusability
- Length: Varies (max 3.81 m)
- Width: Varies with design (min. half of length)
- Height: 991 mm
- Design Speed: Varies up to 72 km/h
